

Lecture 12

HTTP and the First ASP.NET Core Web API

Continuation of the layered Expense Tracker

Endpoint code should call a service, never contain SQL.

- Move from console commands to HTTP endpoints.
- Learn routes, verbs, JSON and status codes.
- Keep endpoints thin.

Domain: data.

Application: use cases.

Infrastructure: repository.

Presentation: endpoints and HTTP translation.

Project: WebApplication host.

GET reads resources.

POST creates resources.

200 is success, 201 is created.

404 means a resource is absent.

- Read the runnable CodeExamples project first.
- Run the Project and identify where each responsibility lives.
- Change one implementation detail without breaking the Application layer.
- Write a short explanation of the boundary you protected.

- Apply the same decision to the student's chosen domain.
- Keep a screenshot or short note for the evolution portfolio.
- Use the database-session model and constraints.
- Prepare one demonstration scenario for the final defense.
