

Lecture 15

Configuration, Error Handling, Identity, Authentication and Final Defense

Continuation of the layered Expense Tracker

Final project demonstrates the entire evolutionary path.

- Externalize settings and secrets.
- Centralize unexpected-error responses.
- Distinguish authentication from authorization.
- Prepare final defense.

Domain: data.

Application: business exceptions and rules.

Infrastructure: persistence.

Presentation: claims and endpoint policy.

Project: configuration and middleware.

Configuration is not hard-coded secrets.

One error handler produces safe responses.

Authentication identifies a caller.

Authorization permits an action.

- Read the runnable CodeExamples project first.
- Run the Project and identify where each responsibility lives.
- Change one implementation detail without breaking the Application layer.
- Write a short explanation of the boundary you protected.

- Apply the same decision to the student's chosen domain.
- Keep a screenshot or short note for the evolution portfolio.
- Use the database-session model and constraints.
- Prepare one demonstration scenario for the final defense.
